

YOUR HOME COULD BE IN DANGER OF A FIRE OR EXPLOSION DUE TO FAULTY GAS CONNECTORS! THESE MUST BE CHECKED BY A QUALIFIED TECHNICIAN IMMEDIATELY!

Gas connectors are corrugated metal tubes used to connect gas appliances in your home to gas sources.

Certain older gas connectors made of uncoated brass (example shown at right) may come apart and cause a fire or explosion! Take action now!

To our knowledge, these brass connectors have not been manufactured for more than 25 years, but **MANY** are still in use. Not all uncoated brass connectors have this flaw, but **all should be inspected by a professional and REPLACED.**

Before you are faced with the possibility of a dangerous gas leak in your home, any brass gas connectors should be replaced immediately with stainless steel connectors. Gas appliances in your home that should be checked include:

Range, oven or cook top Clothes dryer Hot water heater Space heaters

NOTE: DO NOT move an appliance yourself to check the connector! This could cause the connector to break, resulting in a dangerous gas leak. ONLY A QUALIFIED SERVICE TECHNICIAN SHOULD PERFORM THIS TASK!

Connectors should always be replaced whenever a gas appliance is replaced or moved from its current location.

If you smell a strong odor of gas or hear a hissing sound:

- **Leave your house immediately!**
- **Do not use the telephone, cell phone, turn on lights, open windows or light a match!**
- **Go to a neighbor's house and call the number at right.**
